Subject: S/037/081 - comparison of site photos

Joelle,

In my memo for the October 28, 1998 site inspection of Jerry Holliday's Limestone Quarry (on state lands) I stated the need to compare the recent photos with older photos to determine if there were significant changes at the site

On Dec. 30, 1998, I examined the old and recent photos. A comparison of the various photos revealed no significant increase in site disturbance since 1995. Some disturbed areas had simply been mined down. I did discover that the Division estimate of surface disturbance was based on a 1994 inspection when the area was measured and an approximate map was created. Site photos taken in 1995 show some disturbed areas which may not have been included in the Division's estimate.

I recommend that the site disturbance be measured using a GPS unit or hip-chain within the next year.

I described the results of this review to John Blake at SITLA on Dec. 30, 1998.
